"The book shows how rapid social change gives rise to novel religious interpretations and how new religious movements, in turn, try to influence the process of change. This analysis is illustrated by studies of the advanced societies of North America and Europe, of Japan during the first phase of industrialization, and of countries and regions in the developing world. New religious movements are revealed as a normal aspect of social life and as critical indicators of social change. This is reflected in each movement's social composition, teachings, values, religious practices and organizational structures as well as their engagement in politics, business and their structuring of social relationships."--Publisher's description.

What is the unique mission of developmental psychology? How has it evolved historically? What are its current challenges? The chapters in this collection present the view that research, history and policy are essential and interlocking components of a mature developmental psychology. Patterns of human development differ markedly across historical epochs, cultures and social circumstances. Major societal changes examined by contributing authors - the advent of universal compulsory schooling, the adoption of a one-child policy in China, US policy shifts in healthcare, welfare and childcare - present 'natural experiments' in social design. Authors challenge the idea of a clear distinction between basic

and applied developmental research. In sharp contrast with the view that science is value-neutral, developmental psychologists have from the outset pursued the betterment of children and families through educational, childcare and health initiatives. An historical perspective reveals the beneficial, if sometimes contentious, interplay between empirical research and social programs and policies.

First published in 1998. Adolescent development and well-being are both affected by socio-political change, political violence, immigrant status and various types of cultural, social and institutional diversity. These are realities faced by many adolescents in Europe today. This book examines these circumstances, and also the impact of recent socio-political changes in Eastern Europe and conflicts in Northern Ireland. Adolescent identities are looked at, as well as the effects of prejudice towards immigrant youths from their host societies.

Theorizing about the nature, control, and implications of adolescent development has been going on for at least 2000 years in Western culture, utilizing observational and essentially irrelevant and indiscriminate measurement research techniques. However, because these investigations were flawed by prejudgment and excessive subjectivity, the findings tended to be disorganized, irrelevant, incredible, non-explanatory and platitudinous. The most scientifically significant conceptual and research approach to adolescent development in my lifetime was made by Muzafer Sherif (Sherif & Cantril, 1947) of Columbia University during my student days there in the 1930's and 1940's. He insightfully conceptualized adolescence as a transitional, biosocial, interactional and marginal stage of personality development involving an abrupt shift from a derived and dependent status to an earned, independent, competence-based, marginal status and self-esteem with associated personality deficits and compensatory interim status. In my 1952 and thereafter textbooks, I applied this primary and central theory of adolescent development to all of the component functional areas of adolescence. (See Table of Contents) in a textbook of adolescent development (1952, 1954). In addition to its primary role as a graduate and honors undergraduate textbook for psychology and secondary-education majors, this book is also of interest to mental health specialists, pediatricians, counselors, the parents of adolescents and to the teachers of all secondary-school subjects and students.
