This concise but thorough study of courtship behavior in fish, birds, and arthropods is the first rigorous examination of the evolutionary origins and mechanisms of courtship and its contribution to biological success. Demonstrating the fruitfulness of an empirically based, inductive approach to understanding courtship, the book also explains clearly how principles of modern evolutionary theory can be successfully employed in studying behavior. The author describes many observations and experiments that have not previously appeared outside specialized journals and brings an abundance of simple yet accurate examples of animal behavior to bear on explanations of ethological concepts and evolutionary theory. No attempt is made to skim over the gaps of knowledge apparent in the study of behavior evolution; rather, the author discusses the limitations and difficulties of different approaches, critically reviews the deductions that can be and have been made from them, and tries to present enough evidence on controversial points for the reader himself to judge the validity of specific arguments. Indicating how ethological method, firmly based on biological principles, can intensively investigate and illuminate a single area of animal behavior, the book will be valuable to students and professionals in zoology, animal behavior, and experimental psychology.

General Zoology: Investigating the Animal World is an introductory level college biology textbook that provides students with an accessible and engaging look at the fundamentals of zoology. Written for a one-term, undergraduate course of mixed majors and non-majors, this reader-friendly text is concept driven vs. terminology driven. That is, the text is based on the underlying concepts and principles of zoology rather than strict memorization of terminology. Written in a student-centered, conversational style, this educational research-based textbook uniquely connects students and our society to animals from various perspectives—economic, ecologic, medical, and cultural, exploring how the animal world and human realm are intimately intertwined. End-of-chapter questions challenge students to think critically and creatively while incorporating science process skills and zoological principles.
