Brain scans produce detailed images of the brain. They can be used to help doctors detect and diagnose conditions, such as tumours, causes of a stroke or vascular dementia. The two most common types of brain scans are:

- Magnetic Resonance Imaging (MRI scans)

MRI is the most sensitive imaging method when it comes to examining the structure of the brain and spinal cord. It works by exciting the tissue hydrogen protons, which in turn emit electromagnetic signals back to the MRI machine. The MRI machine detects their intensity and translates it into a gray-scale MRI image.

MRI scan - NHS

Magnetic resonance imaging (MRI) of the brain is a safe and painless test that uses a magnetic field and radio waves to produce detailed images of the brain and the brain stem. An MRI differs from a CAT scan (also called a CT scan or a computed axial tomography scan) because it does not use radiation. An MRI scanner consists of a large doughnut-

The brain, spinal cord and nerves, as well as muscles, ligaments, and tendons are seen much more clearly with MRI than with regular x-rays and CT; for this reason MRI is often used to image knee and shoulder injuries. In the brain, MRI can differentiate between white matter and grey matter and can also be used to diagnose aneurysms and tumors.

Neuroimaging. Para-sagittal MRI of the head in a patient with benign familial macrocephaly. Purpose. indirectly (directly) image structure, function/pharmacology of the nervous system. Neuroimaging or brain imaging is the use of various techniques to either directly or indirectly image the structure, function, or pharmacology of the nervous system. It is a relatively new discipline within medicine, neuroscience, and psychology.

MRI - Mayo Clinic

The MRI was invented in 1977 and was a major breakthrough in brain research. MRIs can be used for any part of the body and you may have even had one yourself if you've suffered from an injury.

However, in psychology they are used to study the brain and this is what our focus will be on. MRIs use magnetic fields and radio frequency.

During an MRI, a large cylindrical magnet creates a magnetic field around the head of the patient through which radio waves are sent.
