Despite the fact that there are around 1.2 million powered two wheelers (PTWs) within the United Kingdom, riders are often misconceived as living at the edge of society; however, this is often far from the truth. Riding a PTW is a high-risk activity and those who ride are often perceived as being 'risk junkies', but through an in-depth exploration of this leisure activity, *Motorcycling and Leisure* explains that riders ride because they enjoy it and do not necessarily enjoy the risk involved. The book presents a range of contemporary research on riders and how they find enjoyment. The book further explores the rider goal of enjoyment and utilises Fuller's task homeostasis theory along with Csikszentmihalyi's theory of flow to develop an understanding of the interaction between risk and goals. In conclusion it develops principles of interventions with the aim of guiding intervention design and reducing the number of motorcycle crashes.

This book is intended for a course that combines machinery and power systems into one semester. It is designed to be flexible and to allow instructors to choose chapters a la carte, so the instructor controls the emphasis. The text gives students the information they need to become real-world engineers, focusing on principles and teaching how to use information as opposed to doing a lot of calculations that would rarely be done by a practising engineer. The author compresses the material by focusing on its essence, underlying principles. MATLAB is used throughout the book in examples and problems.

A sequel to "The Devil Wears Prada" finds Andy Sachs and her partner, Emily, blossoming throughout eight years at the head of a wildly successful high fashion bridal magazine only to be haunted by memories of their former boss on the eve of Andy's wedding.

Thoroughly updated and revised, this third edition of Sadiku's Elements of Electromagnetics is designed for the standard sophomore/junior level electromagnetics course taught in departments of electrical engineering. It takes a two-semester approach to fundamental concepts and applications in electromagnetics beginning with vector analysis-which is then applied throughout the text. A balanced presentation of time-varying fields and static fields prepares students for employment in today's industrial and manufacturing sectors. Mathematical theorems are treated separately from physical concepts. Students, therefore, do not need to review any more mathematics than their level of proficiency requires. Sadiku is well-known for his excellent pedagogy, and this edition refines his approach even further. Student-oriented pedagogy comprises: chapter introductions showing how the forthcoming material relates to the previous chapter, summaries, boxed formulas, and multiple choice review questions with answers allowing students to gauge their comprehension. Many new problems have been added throughout the text, as well as a new chapter on "Modern Topics" covering microwaves, electromagnetic interference and compatibility, and optical fibers. This book is appropriate for sophomore/junior level students in electrical engineering. It will also be accompanied by a Solutions Manual, available free to adopters of the main text.
