On March 15, 2006, members from both parties in Congress supported the creation of the bipartisan Iraq Study Group to review the situation on the ground and propose strategies for the way forward. For more than eight months, the Study Group met with military officers, regional experts, academics, journalists, and high-level government officials from America and abroad. Participants included George W. Bush and members of his cabinet; Bill Clinton; Jalal Talabani; Nouri Kamal al-Maliki; Generals John Abizaid, George Casey, and Anthony Zinni; Colin Powell; Thomas Friedman; George Packer; and many others. This official edition contains the Group ' s findings and

researchers are faced with incomplete information about their health status. While LGBT populations often are combined as a single entity for research and advocacy purposes, each is a distinct population group with its own specific health needs. Furthermore, the experiences of LGBT individuals are not uniform and are shaped by factors of race, ethnicity, socioeconomic status, geographical location, and age, any of which can have an effect on health-related concerns and needs. The Health of Lesbian, Gay, Bisexual, and Transgender People assesses the state of science on the health status of LGBT populations, identifies research gaps and opportunities, and outlines a research agenda for the National Institute of Health. The report examines

the health status of these populations in three life stages: childhood and adolescence, early/middle adulthood, and later adulthood. At each life stage, the committee studied mental health, physical health, risks and protective factors, health services, and contextual influences. To advance understanding of the health needs of all LGBT individuals, the report finds that researchers need more data about the demographics of these populations, improved methods for collecting and analyzing data, and an increased participation of sexual and gender minorities in research. The Health of Lesbian, Gay, Bisexual, and Transgender People is a valuable resource for policymakers, federal agencies including the National Institute of Health (NIH), LGBT

Conflict over the extraction of coal and gas resources has rapidly escalated in communities throughout the world. Using an environmental justice lens, this multidisciplinary book explores cases of land use conflict through the lived experiences of communities grappling with such disputes. Drawing on theories of justice and fairness in environmental decision making, it demonstrates how such land use conflicts concerning resource use can become entrenched social problems, resistant to policy and legal intervention. The author presents three case studies from New South Wales in Australia and Pennsylvania in the US of conflict

concerning coal, coal gas and shale gas development. It shows how conflict has escalated in each case, exploring access to justice in land use decision making processes from the perspective of the communities at the heart of these disputes. Weaknesses in contemporary policy and regulatory frameworks, including ineffective opportunities for public participation and a lack of community recognition in land use decision making processes, are explored. The book concludes with an examination of possible procedural and institutional reforms to improve access to environmental justice and better manage cases of land use conflict. Overall, the volume links the philosophies of environmental justice with rich case

across the world to provide a safe local source of water in underdeveloped rural areas, a substitution for mains water for non potable end uses in water stressed urban areas, as well as providing flooding control in monsoonal climates such as Korea, or combined sewer systems such as Germany. The importance of these systems in cities has grown, as water managers seek to provide a range of decentralised solutions to supply constraints of current water supply systems, whilst reducing the impact of urban development on the natural environment, and increasing resilience to the impacts of climate change. Rainwater tank systems are now often implemented under integrated urban water management (IUWM) and water sensitive urban design

(WSUD) philosophies, which take a holistic view of the urban water cycle. Rainwater Tank Systems for Urban Water Supply is based on a comprehensive, multi-million dollar research program that was undertaken in South East Queensland (SEQ) Australia in response to the Millennium drought when the water supply level in the regions drinking water dams dropped to 17% in July 2007 and the area came close to running out of water. In particular, the book provides insights and detailed analysis of design, modelling, implementation, operation, energy usage, economics, management, health risk, social perceptions and implications for water quality/quantity of roof water runoff. The approaches and methodologies included in Rainwater

"This book reviews problems, issues, and presentations of the newest research in the field of cyberwarfare and cyberterrorism. While enormous efficiencies have been gained as a result of computers and telecommunications technologies, use of these systems and networks translates into a major concentration of information resources, creating a vulnerability to a host of attacks and exploitations"--Provided by publisher.
